I have Mac OS X machines connecting to an SBS server that's running the built-in File Services for Macintosh.

in the past it was conected by ethernetand works great, now we are trying to connect by wireless but only the internet conection is working, when we try to connect to server it say they can reach it same case to printers

Hi Heriberto!

Without knowing more about your network setup, answering your question may take a few responses from folks.

Have you verified that your Macs and your server are on the same network? Do they both share IP addresses where the first three numbers are the same (e.g. 192.168.0.xxx)? Or are the Mac IP addresses very different from the server's IP address (192.168.0.xxx compared to 24.128.17.xxx)?

If you could post the first two numbers of the IP addresses you have this would help in troubleshooting and you won't be disclosing anything personal or risking security.

Also, how is your wireless device configured? Is it a router or a bridge on your network?
