Here's what I have, bare with me on this. All machines and servers are win2k

Lan1 = 192.168.1.0

Lan2 = 192.168.2.0

Both of these lans have there own router attached and are connected to one switch that is parted into 3 vlans. I have resources (mail,printing file sharing) on lan1, I have a dhcp server that has two nics one to each lan. The resource servers only have one nic but have multiple ip's assigned to them, one for each lan. All servers on lan1 are registered with wins and dns with an address from lan1. when I try to ping one of these servers by name from lan2 it returns with the address from lan1, which makes sense

because they get there name resolution from wins, How can I get these machines to

find these servers on the local lan by name ? I know I can use lmhost files in each machine but wanted to avoid having to place this on all machines.

Any ideas would be greatly appreciated. thanks.
