I have an employee who came back from lunch and went to log on to her Win 2000 machine and could not do so. We are on a domain with a 2000 SBS Server with active directory. When going into Network Neighborhood on the Server i see that her PC has put itself in it's own workgroup named "Workgroup". The dropdown box in her login box that lets you choose Domain or local PC is gone. Her username and password will not work nor will the administrator or any local account on that PC. Tried doing a Repair with the 2000 disc but didn't help. Tried logging in as Guest and as Administrator with a blank PW as suggested but also didn't work. I am almost in tears. Has anyone run into this before? Any help would be greatly appreciated. I don't want to have to lose all the important data and e-mails stored on her HD by reinstalling.
