Upgrades can be buggy to say the least. Make sure that Client for Microsoft Networks is installed and enabled in the network adapter properties and also check in tcp-ip properties/advanced/wins that netbios over tcp/ip is enabled. Ipconfig /all will also show if it is disabled. In Computer Management/services make sure that the following services are set to automatic and started - workstation, server, tcp/ip netbios helper, dns client, and dhcp client. Also check in Event Viewer for any pertinent errors and install the support tools from the install disk under support/tools where you will have to run setup and run the netdiag utility looking for any failed tests/errors/warnings which you may get some but others may help pinpoint the problem. --- Steve
