We have a company of 40-50 people all working on Win2K Pro and they will be staying on Win2K Pro

They are running on domain X at the moment on one set of servers

We have some new servers which will be running on domain Y shortly. We have added all the users on to Active Directory on this new domain

What we wanted to do was to do some sort of file and settings transfer backup (My docs/Internet favourites/printers etc nothing complicated on their desktops while logged into the old domain and then retransfer these settings when we log them on to their PC's on the new domain.

We tried the USMT but this didnt work when running loadstate when one test user was logged into the new domain.

Since found out this tool is only for migrating user settings from say 95,98 to Win2k or XP i think, not between the same operating system in this situation

Is there any tools available to do this as we have come to a halt

Any help would be greatly appreciated.
