Hi,

I have three computers, one running Windows XP Home, another running windows 2000 server and the last one running windows 2000 pro.

All computers have network cards, with the machine running Windows 2000 Server having two. Crossover cables connect the WinXP to the Win2kServer and the Win2kPro to the Win2kServer.

The WinXP computer has access to the dial-up internet connection, which is to be shared with all computers. This has been set up.

The problem is I am unable to connect to any computer from the Win2k Pro machine. No other computer can see it either, by pinging or otherwise.

I thought that there would be a Bridge connections option in Win2k Server to solve this problem but I am unable to locate it.

Buying a hub is not currently an option.

Is there a way to connect these computers together without the purchase of a hub but for every computer to see every other computer, and use the WinXP shared internet connection.

Hope that this makes sense.

James
