Marc:

There are several types of caller authentication available that a host computer can be set to in pcAnywhere.

Your host computer is probably currently set to use Windows or ADS (Active Directory Service) authentication which would require a domain

login.

Change this on your host computer to an authentication type of "pcAnywhere" which will not require a domain name be entered by the caller. As listed in pcAnywhere's help under "Authentication", do this as follows:

To configure a caller to use pcAnywhere Authentication

1. In the pcAnywhere Manager window, on the left navigation bar, click Hosts.
2. In the right pane, under Hosts, right-click the connection item that you want to configure, and then click Properties.
3. In the Host Properties window, on the Callers tab, under Authentication type, click pcAnywhere.
4. Under Caller list, click the New Item icon.
5. In the Caller Properties window, on the Identification tab, type a logon name for the remote user.
6. Type a password.
7. In the Confirm password box, retype the password.
8. Click OK.
9. In the Host Properties window, click OK.

By the way, you got this mistakenly set when you created your host using pcAnyhwre's wizard, where you were asked the type of authentication that you wanted to use and mistakenly chose Windows. Next time choose pcAnywere.

Hope this helps.
