I have a small LAN consisting of 3 computers. Let's call them Win98 A, Win 98 B and Win 2000. All 3 computers are set with the same workgroup name and all are set to enable file and print sharing. All computers can see each other in the network neighborhood. However, neither Win 98 B nor Win 2000 can map a network drive to the Win 98 A machine. The Win 98 A machine can map network drives to either the Win 98 B or the Win 2000 machines. The Win 98 B can map network drives to the Win 2000 machine and vis versa. So in effect, nobody can get to the hard drive on the Win 98 A machine, but the Win 98 A machine can get to everyone else's hard drive. How can we correct this problem?

Everything was working fine in the networking department until we had several power failures and despite having a UPS, I was forced to reload Windows on the Win 98 A machine.
