I have a laptop running Windows 2000 Service Pack 4 and when the user is connected through ADSL and the Cisco VPN client they have problems saving files to certain shares on the corp network. They also cannot reply to or forward emails in Outlook, without getting a "Network problems are preventing...". Yet when the laptop is connected to the trusted LAN in the office all works fine. The Event Viewer reports Event ID 50 "The system was attempting to transfer file data from buffers to \Device\LanmanRedirector..." with source MrxSmb. Any ideas on what might be causing this? Thanks.

Regards,

Randy
