We have a mixed mode Windows 2000 AD Domain. Today I installed a new XP Pro workstation. The workstation is not joined to our domain but it should connect to four different network shares on three Windows servers (1 Windows 2003 member server, 1 Windows NT 4 member server and 1 Windows NT BDC) via passthrough authentication in our domain.

The client can connect to the Windows 2003 shares but the NT shares are unavailable to that user account.

When I try to map the resources I get error message 1331 that says the account is currently disabled. I tried the user account also from one Windows 2000 workstation in our domain and it does not work either. With another similar user account it works well. First I joined the workstation to another domain with no trust relationship to our domain. Then I rejoined the computer to workgroup and deleted the computer account from the domain. I have also recreated the user account several times both in our domain and on the another domain/workstation.

Could it be some kind of a secure channel problem? After I connected the workstation to the network I was unable to connect it's default administrative shares with administrative account from our domain. It just complained about wrong username and password. The user account has enough permissions through the share and NTFS level.

I tried it this way (netlogon.bat):

```
net use * /d /y
net use h: \\server1\share1 /user:ourdomain\account /persistent:yes
net use r: \\server1\share2 /persistent:yes
net use s: \\server2\share3 /user:ourdomain\account /persistent:yes
net use t: \\server3\share4 /user:ourdomain\account /persistent:yes
```

The two first shares are fully working but the last two are unavailable.
