Richard makes a good point here. Cached logons can be disabled in a policy. There's no way around that one. Also, roaming profiles are generally copied from the network location to the local computer so that cached logons will work even with the roaming profiles. But that, too, can be disabled, or My Documents and such can be redirected and offline files disabled so there's no local copy.

Are cached logins enabled or disabled in GPO?

thanks kurt,
how would I know if it has synched or not. The fact is when he logs on,
it
says he is a roaming profile user. Should it read local instead?
thanks

"Kurt" wrote:

If your profile is synched and it hasn't been too long since
you had an
actual connected logon, you should log right in. After a while
(long

time)
your "cached credentials" will expire and you'll need to
actually
connect to
the network. I log on to my laptop (using my domain logon)
for weeks at
a
time without ever connecting to the work LAN.
