Hi there,

I also have following errors, maybe they are relevant:

I have NT4 domains with trusts, I also have an Active Directory domain with full trusts with NT4 domain.

5719, netlogon, error

This computer was not able to set up a secure session with a domain controller in domain ABC due to the following:

The RPC server is unavailable.

This may lead to authentication problems. Make sure that this computer is connected to the network. If the problem persists, please contact your domain administrator.

### ADDITIONAL INFO

If this computer is a domain controller for the specified domain, it sets up the secure session to the primary domain controller emulator in the specified domain. Otherwise, this computer sets up the secure session to any domain controller in the specified domain.

8021, source browser, type warning

The browser service was unable to retrieve a list of servers from the browser master \\PDC on the network  
\\Device\NetBT\_Tcpip\_{E480806F-1E8F-48C1-8528-D58D5C442397}.

Browser master: \\PDC

Network: \\Device\NetBT\_Tcpip\_{E480806F-1E8F-48C1-8528-D58D5C442397}

This event may be caused by a temporary loss of network connectivity. If this message appears again, verify that the server is still connected to the network. The return code is in the Data text box.

Thanks, Calin

Hello tester,

Have a look here:

no rights.

Hi there,

I just installed a new W2003 server with same name/IP as an old server to

replace it to an NT4 domain.

I am getting following error on the server event viewer and even when

I try

to do a :

net view /domain:abc from the command prompt

Event ID 8021

The browser service was unable to retrieve a list of servers from the browser master \\Server1 on the network

\\Device\NetBT\_Tcpip\_{E480806F-1E8F-48C1-8528-D58D5C442397}.

Browser master: \\Server1

Network:

\\Device\NetBT\_Tcpip\_{E480806F-1E8F-48C1-8528-D58D5C442397}

This event may be caused by a temporary loss of network connectivity.

If this message appears again, verify that the server is still

connected to the network. The return code is in the Data text box.

Net view output: system error 52 has occurred. You were not connected because a duplicate name existst on the network. Go to system in control panel to change the computer name and try again.

Should I remove its computer name and all references from Wins records?

I cannot change the server name.

Thanks a lot, Calin
