Hello friends!

We have 3 subnets in our network.

192.168.42.xxx

192.168.52.xxx

192.168.62.xxx

Routing is Ok , so I can ping the workstation
on every segment from any other workstation.

Active directory is not activated.

On the windows 2003 server (on the segment 62)

is IsDomainMaster in the registry set as True

hoping that it will become the domain master browser collecting browser
lists from master

browsers on the other segments.

We are still viewing only the workstations on the segment we are on.

Is it possible to set up the whole network to see all workstations on all
segments , or it is impossible without active directory?

Thanks

.
