Hello George,

Thank you for using newsgroup!

From your post, I suggest you check the following suggestions:

1. Check the network card to see if it is working fine.
2. Check if the issue occurs on other machines when they ping the Windows XP machine.
3. Use IPconfig /all command to check the IP configuration on the problematic machine to see if all IP addresses have been assigned.
5. Ping the loopback address (127.0.0.1) to ensure that TCP/IP is operating properly on your system.
6. Ping the IP address of the local (your PC's) network adapter card. This will ensure that TCP/IP is bound to the adapter and will provide a check for duplicate IP addresses.
7. Ping the default gateway on your network. This verifies that the local subnet is functioning and that packets addressed to other subnets will reach the default gateway.
8. Ping a computer beyond the default gateway, to ensure that packets will be delivered to remote networks.

Please let us know the results step by step.

Thanks & Regards,

Ken Zhao

| I'm having this really strange problem. I recently had to rebuild one of
| our
| Windows XP PC's. We run a windows 2000 domain enviroment. After
| rebuilding
| and rejoining to the domain I have been unable to ping the XP PC from my
| machine. The XP machine can ping me without a problem. The IP address
| is
| correct when I try to ping it by name. I tried to pping by straight IP
| with
| no luck. I went as far as dejoining the PC from the domian, deleting the
| computer account from active directory, delete any references in DNS or
| WINS
| and hen rejoining with no luck.
