Hi Alan,

I went through the links. It looks like it is talking about 2 things.

The first link is talking about SMSINST (Which is more related to SMS server), and I do not understand this part. As, I am talking about users who are printing to Windows Server 2003/Print Server and Windows 2000 Professional and Windows XP Pro.

The second link is talking about changing the registry settings and values. Does this need to happen on the workstation side or on the server side?

As, I had mentioned in my previous reply, that I have the "Enterprise Domain Controller Security Template". Is there something that this would be causing an issue and I need to change some settings on the security side.

Local Security Policy MMC snap-in

1. Click Start, point to Programs, point to Administrative Tools, and then click Local Security Policy.

Note If you cannot perform this step because "Administrative Tools" does not show up in the Program list, then click Start, point to Settings, point to Control Panel, click Administrative Tools, and then click Local Security Policy. Then proceed to step two.

2. Under Security Settings, double-click Local Policies, and then click Security Options.

3. Double-click Additional restrictions for anonymous connections, and then click No access without explicit anonymous permissions under Local policy setting.

4. Restart the member computer or domain controller for the change to take effect.

Back to the top

RestrictAnonymous registry value

Use Registry Editor to view the following registry key, and then add the following value to this key, or modify it if the value already exists:

Re: Access Denied, Cannot connect

HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\LSA
Value: RestrictAnonymous
Value Type: REG_DWORD
Value Data: 0x2 (Hex)

Restart the computer after any change to the RestrictAnonymous key in the registry.

Hi Alan & Steve,

Thanks for the information and the reply
