for proper routing, the network you are dialing in from must be on a different subnet then the one you are dialing into. Below are some examples

Ex of Improper config, and what you probably have:

Local Desktop 192.168.1.38
 255.255.255.0
 192.168.1.1 (VPN overrides when connected and points to 192.168.1.254)

Remote Server 192.168.1.2
 255.255.255.0
 192.168.1.254

^— this will not work because the routing tables can not properly determine if the traffic is local, or remote(through the VPN tunnel)

Ex of Proper Config:

Local Desktop 192.168.5.38
 255.255.255.0
 192.168.5.1

Remote Server 192.168.1.2
 255.255.255.0
 192.168.1.254

^— With this config, your desktop(client) machine will be able to determine which network to pass traffic to, while still using your local connection for internet access.

Ex of working, but improper config (for most cases, this will be needed in certian cases)

With this you will connect remotly, but internet access will be very slow. (ie. VPN session

is using default gateway on remote network, tcp properties -> advanced)
Local Desktop 192.168.5.38

microsoft.public.win2000.ras_routing: Re: vpn get in, but cant see anything

255.255.255.0

192.168.1.254 (note, this will still say 192.168.5.1

in your LAN settings, the

VPN session settings will override this when connected)

Remote Server 192.168.1.2

255.255.255.0

192.168.1.254
