How to Configure Windows server to Be a Router

To setup Windows 2000/2003 as a router for a LAN, you need to two network adapters. To enable LAN routing, go to Administrative Tools>Routing and Remote Access>Action>Configure and Enable Routing and Remote Access, and then complete the wizard. Right-click the server for which you want to enable routing, and then click Properties>General>Router, check Local area network (LAN) routing only, and then click OK.
