Generally the error 930 is caused in the following cases:

1. When your RADIUS server is not reachable from your VPN server.
2. This issue may occur if the computer account has permissions to read the Active Directory directory service record, but it does not have permissions to write to the Active Directory record.

To verify the user permissions in the Active Directory Users and Computers snap-in on a Windows 2000 domain controller. To do this, follow these steps:

- 1.. Click Start, point to Programs, point to Administrative Tools, and then click Active Directory Users and Computers.
- 2.. Expand your domain.
- 3.. Right-click Domain Controllers, and then click Properties.
- 4.. Click the Group Policy tab, click Default Domain Controllers Policy, and then click Edit.
- 5.. Expand Computer Configuration, expand Windows Settings, expand Security Settings, expand Local Policies, and then click User Rights Assignment.
- 6.. Double-click Access this computer from the network.
- 7.. By default, the Administrators, the Authenticated Users, and the Everyone groups are assigned this user right. If these groups are not assigned this user right, add them. To do so, click Add, locate the user or group you want to add, and then click OK two times.
