Kevn,

Did you have any success in getting your DNS over VPN problem solved?
I'm having what sounds like the same issue.

I have servers that have an external IP address and an internal address. They have a DNS name associated with the external address, hosted by one of the internet's Domain Name registrars. I have created special DNS records on my internal DNS server for these servers so that I can get to the internal address by the same DNS name.

However, while VPNed in I still resolve the DNS name to the external address, implying that I am using my ISP's DNS rather than the DNS that should be provided by the VPN.

One difference from your description is that it seems to be sporadic – occasionally I do properly resolve the internal IP address while VPNed.
