I have a VPN running on a windows 2000 server at work.
>From home I have several computers running windows 2000 pro service pack 4 and others running windows xp pro sp 2. From the windows 2000 machines there is no problem connecting to the VPN server. However, from the xp machines the connection attempt often returns error 721. I get the verifying username and password box and then error 721. If I keep redialing eventually, I can make a connection. I have found several other discussion groups that describe this problem but have not been able to find any where someone has provided a solution. I found a Microsoft VPN document that suggested turning the ValidateAddress off for the PPTP connection and I have done this but it does not help. Any help would be appreciated.
