Create a login script, set it to be used for the User Configuration (using gpedit.msc).
In the script use the reg.exe command to change the item in the registry.

Hi

I need to make a change to our Windows 2000 image that will take effect for all users that have or will log into the machine.

Basically the setting that I need to change is to allow Internet Explorer to spawn a new window when an internet short cut (IE sent in an e-mail) is activated. I have found the setting in HKCU but that will only correct the setting for the current user.

I did find that there was a change to the HKUsers as well but if I understand the registry everyone will have there own entry in this section and only the current users settings are loaded there.

How can I automate the changing of this registry key for all users that log into the machine.

Thanks in advance for any help
