Issue: During unattended installation of Windows 2000 Pro the monitor goes black.

We have a new monitor on our dell machines that has two video outs. We build our machines using a PXE remote install and use the pnplay path for all of our drivers. I know if I leave the drivers out of install for video it will load the entire way and basically have exclamation marks asking for a video driver. I can install driver in windows and it install enables both video outs. Now everytime I include drivers for unattended install the screen goes black. I know this has something to do with the two video outs.

My question is how can I some how keep the drivers in my pnp path but somehow enable the video so the monitor is not black?

I did look in the BIOS to somehow disable one of the video outs and it was not an option.
