There is no such registry hive as "local user". It's either  
KHEY\_LOCAL\_MACHINE or HKEY\_CURRENT\_USER.

Since you describe access denied problems, I'll assume that you  
want the users to modify a key in HKEY\_LOCAL\_MACHINE (users  
normally do have write permissions to their own profile in  
HKEY\_CURRENT\_USER).

You can open the registry with regedt32 and change the permissions  
on individual registry keys.

But is this really what you want? Since all users will be writing  
to the same key, the last user to logon will "win"!
