I have a person at my office who received a laptop for Xmas, mostly uses at his home where he connects to AOL using a phone line connection. He also wants to use at the office (we have a T1 line-Broadband). I had assigned a IP address to the laptop and after several attempts and calls to his cable company (he also uses a cable connection on a desktop at his home and likes their version of e-mail), I had him connected ok. Now something has changed and I am unable to connect him here at the office. I have tried many different scenarios and connections, nothing works. I'm not sure what happened. Also, I can't seem to locate the IP address file anymore. He has XP home ed. on the laptop. Any ideas what the problem might be or how I can get this connection to work again.

Thanks

Amberlady
