Hi all,

it's Windows XP SP1 box. I activated filter keys and applied it to logon desktop (i.e. login screen, the box is on domain so you need to hit ctrl-alt-del to login) – by mistake, of course.

Now the keyboard input is filtered, it doesn't allow multiple keys action, I cannot login to the system at all.

Windows shortcut that apparently can toggle the feature (hit right shift key 8 times) doesn't make any difference. The box is a laptop?!

I tried USB keyboards etc. attached but they are also filtered.

Any suggestions? I can boot into WinPE like environment to hack the system, do you know which files and/or registry keys are responsible for Filter Keys feaure?

Will also ask IT staff to perform SMS session on it, the other idea is WinXP Remote Assistance...

Alex ;(((
