Disconnect all Devices attached to the machine and start just with Mouse, Keyboard, Monitor, are you able to login?.
Try to reset the BIOS to Default, I found it to be a solution when an install didn't complete and Halting the system and prevent it from Boot Up (it did happen with a printer setup).

The problem is that I can't get into windows in any way.
I reaches the seceen with different user and when i logg in there it accepts the login but during login it starts logging out.
I suspect that there is a program that want to restart after installation that have gone wrong. I made an update for Spyboot search and destroy that needed reboot but I replied I will turn of later, witch I did and thats when the problem started.
I also did run Wise disc cleaner and Wise reg cleaner and maybe these applicatons did something wrong. I did only delete green items, so I don't think this is a problem more likely the restart.

I get logged out direct after I have logged in. I don't even get the screen
just login sound and message login a short view of desktop at first attempt
after a restart but not the following login attempts. Then it says logging out

RE: Loged ot direct at login

and the music plays logout tune.

you have hardware issue, did you install any new hardware or software recently?.

Try to boot into safe mode by Tapping the F8 Key until you get the Boot Option menu and select Safe Mode, there Restore the system to a working point

or you can troubleshoot from there by investigating the issue further by checking the Device Manager for malfunctioning Devices or conflict in the IRQ.

Also look in the event Viewer for error messages that can shed some light on the causer of your issue.

Open a Notepad, customize or minimize to the taskbar as you will need it later for this step to copy the error message on it.

Open a run command and type in:

eventvwr.msc click [OK] you will get the Event viewer control Panel.

click on each of these:

Application

System

Security

Look in the right Pane/window for error message with red (X) or Yellow exclamation mark /\ , double click each one to get more info about the causer.

On the Event error properties message you will see:

Up Arrow

Down arrow

Two pages

Click on the two pages to copy the error message then bring up the Notepad you opened earlier and right click on the first line and select Paste from the list, this will paste the error message on a Notepad.

Please don't duplicate the error message one of each kind will be sufficient.

HOW TO: View and Manage Event Logs in Event Viewer in Windows XP
