Thanks a lot Papa-

Although I'm not interested in gaming or running lightning quick XP, the general concensus seems to agree with your assessment. Do you have any experince getting on-line with a cell phone and laptop? I'm going to need to work from out of town for about a week in April and I'm concerned that I may not have interenet access so I'm investigating getting on line with my Toshiba and originally thought XP would work better (a lot of the software seems to require XP for a USB connection) but it would seem that win98 is fine going through the serial port. Any thoughts, suggesstions? -b
