No e-mail sharing at all. Just aquatinted through technology. Writing zeros because they found it to be the quickest way to resolve the problem. Maybe not the most orthodox way...however they found it to work...quickly. It's not really an issue with a router, rather it is an issue with a blue screen and a stop order.

A low level format of the hard drive is not going to resolve an issue with a router. Three friends with a similar problem all having to low level format??? Perhaps this is a virus that the 4 of you are sharing.
