The lack of a Standby button indicates you are using XP's generic VGA drivers.

Your video adapter drivers probably need to be reinstalled. Visit the support web site of the manufacturer of your video card adapter and download the latest drivers.

Before installing them, uninstall the old drivers. In your Control Panel, open the Add or Remove Programs applet and look for your video drivers to uninstall.

If you happen to have a notebook computer, visit the notebook manufacturer's support website to download the correct video adapter drivers for your specific notebook model.

After installing a fresh set of drivers, right-click on your desktop and select Properties > Settings, change the Color Quality to "Highest (32 bit), then adjust your Screen Resolution to your liking, then click on Apply.
