Hey there,

First post here,

Is there any pressing issue with windows XP home when upgrading to a different mother board and processor of different type or make?

I know there will be some sorting out to do with drivers and such, but will XP just change its configuration or will it explode or worse? I've not had any problems before but a store tech suggested the idea that it might.

I'm migrating XP from a P2 300 MHz (its grandpa s) to an AMD64 3000+.
Any help would be greatly appreciated!
