"Me/PDX" <me@xxxxxxxx> wrote:

How do I go about to reduce my CPU percent (%) usage in Windows Task
Manager?

At this very time I have 17% – 29% usage.

I was told thru a tech call that this usage should be 7% or less.

My processes is not at 53.

Thanks for your assistance and consideration!!!

Launch Task Manager and go to the Processes tab. Click twice on the
CPU column header to sort the process list based on CPU usage with the
highest usage items at the top.

Post the names of the items that are using the most CPU time back
here. Disregard the "System Idle Process" as that is just a filler
entry showing the proportion where the CPU has absolutely nothing to
do.

Good luck
