Hi,

I'm having this problem with a PC... The problem is, the PC logs off whenever any user tries to log on. This has been happening ever since someone inserted a VCD into the PC, which had some autorun application written to it, just for the sake of preventing it from being copied.

My guess is, the application put some values in the system registry in one of the following locations:

HKLM\Software\Microsoft\Windows\CurrentVersion\Run
HKCU\Software\Microsoft\Windows\CurrentVersion\Run
HKLM\Software\Microsoft\Windows NT\CurrentVersion\Winlogon

or any other location which would enable the little thing to run. That is why I have to check out the registry, but I'm unable to access it in any way. The system logs off in all the start-up options including the safe mode.

So the next logical option is the Recovery Console, and it doesn't allow the REG command.

Maybe one of you guys know the fix to this problem... Please tell me if you know. Is it possible to enable the REG command in the Recovery Console?

I don't want to reinstall windows each time this occur because I can't get my hands on a genuine copy of Windows XP. The copy which I have turned out to be a pirated copy... and for each installation I have to have a

Re: Registry editing in recovery console

license.

Please tell me.

Thanks in advance.

Shafiee.
