mooky wrote:

sorry to post again so fast, but checked event viewer and got this
AML: ACPI BIOS is attempting to read from an illegal IO port
address (0xcfc), which lies in the 0xcf8 – 0xcff protected address
range. This could lead to system instability. Please contact your
system vendor for technical assistance.

Phil Weldon wrote:

Well, did you follow the directions?

It is important to take an organized approach to solving computer
related problems. Measure twice, cut once.

mooky wrote:

what directions would that be? I read a lot of sites that had that
problem...microsoft says update the BIOS..I have an older pc and no
updates for my BIOS...looked into BIOS updates months ago...I still
never found out if anyone found an actual solution that worked
really...this is causing my pc to freeze and I have to push the
power button to reboot...I am sure this is also causing my start
lag as well...

Re: DHCP causing start lag XP?

And have you read my reply to your just previous thread?

Mooky,

To help you out – this is the 'previous post' that Phil is referring to:[http://groups.google.com/group/microsoft.public.windowsxp.basics/browse...](http://groups.google.com/group/microsoft.public.windowsxp.basics/browse)

This particular post can be seen in full here:[http://groups.google.com/group/microsoft.public.windowsxp.basics/browse...](http://groups.google.com/group/microsoft.public.windowsxp.basics/browse)

This other post from you leads me to believe you have some serious HARDWARE issues you need to resolve – most likely due to defective/mismatched memory. Some possibility of power issues and/or a bad motherboard.[http://groups.google.com/group/microsoft.public.windowsxp.basics/browse...](http://groups.google.com/group/microsoft.public.windowsxp.basics/browse)

And last – I see you had some serious cable modem issues before you got it replaced – so there is a possibility it was your network card/network card driver this whole time – have you updated your motherboard chipset and network card drivers from the manufacturer's download support web sites?[http://groups.google.com/group/microsoft.public.windowsxp.basics/browse...](http://groups.google.com/group/microsoft.public.windowsxp.basics/browse)

How To Ask Questions The Smart Way<http://www.catb.org/~esr/faqs/smart-questions.html>

as I said earlier...I have an older motherboard with the via chipset and already had all the updates I can get..I know it wasn't my network card drivers...already tried that before I got the modem upgrade...I'm getting the full speed I paid for since the modem upgrade...the AMLI: ACPI BIOS is attempting to read from an illegal IO port

address (0xcfc), which lies in the 0xcf8 – 0xcff protected address range. This could lead to system instability. Please contact your system vendor for technical assistance error is what I believe to be the main culprit and causing the random freezes and start lag after doing some reading about it on many sites. I wish there was a fix for that instead of updating the BIOS since I am unable to do so.
