Not too sure what you are trying to do here but if you want to hear the output from the microphone through the computer speakers like a PA amplifier this won't work on all computers. Apparently some drivers don't allow that to occur and some do. One of my laptops, if I turned on the microphone to record from it without turning down the volume on my speakers, I would get terrible feedback. The second computer model from the same manufacturer, I couldn't get the sound out at all but could record voice and playback later.

Same has happened with a couple of my older desktops with 98, 2000, ME and pre SP XP but I haven't tried it lately with my newer computers.

Hi wondering if anyone could help with an audio issue. I have recently bought a brand new computer and the playback on the mic does not work. I can record sound no problem, but I can't hear the sound when I play it.

When I open volume control, there is no option for mic. Now this is the tricky part – when I go to options > properties, there is no option for playback on the mic. I have two devices available, HD input 1 and HD output 2 (and a third option for digital but that doesn't matter). When I open the settings for HD input, 'playback' is greyed out. I've reinstalled all my drivers and nothing happens, so I guess this is XP being silly and that this is a registry issue.

My sound card is a VIA VT1618 @ VIA VT8237A High Definition Audio Controller on a VM900M motherboard. If anyone can lend a hand that would be great.

Cheers
