OP: Stick with the TI you have. IT's capable and will fill the bill. Don't add more confusion by adding a new app; it's counterproductive when you already have it.

You probably want the "clone" feature. Clone to the drive W, make drive C a non-existing letter, and rename W to C. If your boot drive isn't C it'll create confusion later on, down the line. Other than possibly drive size, nothing to switch in CMOS that way either.

XP/SP2 and programs on C: drive, there are also 2 partitions D: & E: on the same IDE drive on Primary IDE channel.
I have added a 250GB SATA drive partitioned into W: & X:.
Would like to move OS and programs from C: to the W: partition on the SATA drive.
I have Acronis True Image v10 and have gone through the help files but I can only see how to clone the whole drive to another whole drive, not clone the active partition only to another partition.
Am I missing something here?
Any advice appreciated.

Re: Move OS to SATA drive?

I do not know Acronis software – I usually use BootIt from <http://terabyteunlimited.com/> . The problem may be that partition should be copied to free space on another drive. Try BootIt – IMO it's much easier to use.
