Hi,

I recently was running msconfig in order to try to cut down on resources that I was using since my Toshiba has been running on XP since 2002, and to my wonder, many devices and the device manager itself doesn't load (in the hardware manager, under System Properties).

The other devices/things that aren't running are Sound, USB, printers, and networking. So I'm somewhat dead in the water. My Toshiba Recovery CDs don't work, and I had temporarily turned off the Windows recovery points.

The Device manager window won't even populate any devices. It's as if my computer doesn't know how to find its old configuration. Somehow, the A drive and PCMCIA device that reads my flash card work for transferring files, so I can still work with general programs not needing Internet/network access.
