I have a remote user whose computer was a member of domain "x", and when he logged in to his computer he logged into domain "x" on that computer, I assume that the computer is using cached credentials because it allowed him to login to the domain, although he was not connected to any domain controllers.

The user then changed his logon type from a domain to a workgroup, he now wants to return to the domain so he can use his old profile, and have outlook and all his programs already configured. I had him login locally to his machine and then vpn into the domain and then join the domain. He then had to reboot. However when he try to login again the domain "x" was not available as an option to log into. Is there any way to restore it so he can use his old profile that was associated with domain "x"

Thanks

.
