What power scheme are you using in Control Panel> Power Options?

When you say that it goes through the whole boot process again, is it starting over from POST or just from the welcome screen?

If just from the welcome screen, uncheck the box next to Prompt for password when computer resumes..." If using a screensaver, uncheck a similar box in the screensaver settings as well.

If it's going through the entire boot process (POST, loading Windows and so on) then you'll need to dig deeper. Look in Event Viewer for any errors noted at the time the system goes into standby or when you try to resume. Am hoping you can find a clue referencing a driver or a program here.

If no luck, try disabling all running programs including those that run in the background. Put the system into standby and try a resume. If successful, then there is a program incompatibility that you will need to track down.

If not successful then a driver or device is not complying with the rigors of standby and resume. What drivers were updated recently? What hardware was added since the machine hibernated correctly? May need to check with the hardware manufacturer for a newer driver that is more standby-friendly.
