Ah, I see what you're saying now. This feature was often seen on laptops a few years back. The desktop was displayed as a "window" that extended past the boundaries of the monitor. Some renditions of this type of desktop included scrollbars at the edges of the desktop to guide you into those extended areas.

Well, shoot. Now I know what you mean but I don't know of any stand alone programs that can accomplish the same thing. All of the ones that I have seen like this – the capability was built-in to the display driver.
