Hi Everybody!

I shall be grateful if you can be of any help solving my problem mentioned below. You can email me at [p\\_buv@rediffmail.com](mailto:p_buv@rediffmail.com)

I have a desktop computer with Windows XP Professional Edition with AMD Athlon 2000+ processor. The problem with this computer is that it has become too slow to work with. To give you a clear picture, I give below the facts:

- 1) Its C: drive has a total of 18 GB capacity of which 2.18 GB is free.
- 2) It has a Norton Anti-Virus software which is uptodate and does not show any virus threat.
- 3) The computer is often connected to the Internet and is firewalled. Any infected files/virus trying to sneak into the computer are detected/deleted by the Anti-Virus software.
- 4) It takes about 2 to 2.5 minutes to boot up and again takes about 1.5 to 2 minutes to shut down.

Are all the above problems relate to the slow performing AMD processor or is it due to heavy usage of C:/ drive or is it due to some unknown virus that might have crept into the computer ? Be kind enough to resolve the above issues.

PRADIP...
