Yes KM, those are the instructions directly from the MS site, I followed them to a T.

I rebooted into dos, and I see the files are actually on the C: drive, I can see in fdisk that that particular partition is active. Although right after the memory count and the IDE seeking, it just holds at a blinking cursor in the upper right hand corner.

I tried the timeout change, but alas nothing?

It has to be Fat file format for a specific reason so I can't swap to NTFS...

I hear people talking about using xcopy to copy the image over. But in a 16bit pure dos mode this can't be done since it only supports 8.3 file extensions correct?

Any idea as to what might be wrong, like I said, the files are there, the partition is correct, it's simply not booting?

THANKS KM!
