Doug,

If you setup your XPe Tools to access DB through a network path (\\machinename\xxx) it is the network permissions.

If you don't want to think about that, change the path (in CDM) to a local path.

Ohterwise, make sure that the user you are logged in has enough permissions to write and change files on the network share.

Usually, when i update components with repositories, I delete repository directories first.

KM
