I created a component (really just a import of a .inf to create and intel graphics chipset component), using the component designer. I folowed the steps in Sean Liming's Windows XP Embedded Advanced book, and these same steps worked for a Dell Monitor driver component I created earlier. However, when I try to add the component to my configuration in the Target Designer, I get:

Info 101: Initializing new component: "Intel(R) Graphics Chipset (KCH) Driver [Version 5.00.2195.1, R3]"

Warning 1116: Adding unreleased component to configuration: "Intel(R) Graphics Chipset (KCH) Driver [Version 5.00.2195.1, R3]"

Warning 1121: Can not find file resource paths for 'Intel(R) Graphics Chipset (KCH) Driver'. Please check the component definition.

Warning 1121: The estimated configuration size may not be accurate.

Info 101: Estimated footprint: 0 Bytes

What does the 'could not find file resource paths mean? The files are in the repository. The package/component look fine when I examine them in the component database.

If I look at the Source Size column for the files under the component, they are all 0 bytes. And If I try to build, I then get:

Error 1005: File not found: "ikch8xx.cat"

Error 1005: File not found: "IKCH8XX.INF"

Error 1005: File not found: "ialmkchw.sys"

Any ideas why I can't successfully add the component to the configuration?
