Hello everybody!

I have a XPe SP1 running. It works so far, except that my Acer WLAN PCCard is not recognized when I insert it in the PCCard slot (The slot and the card are ok, I have tested this with Win XP prof.). I have a CD with the driver which says that the card must be inserted, before I can install the driver. Therefor IÂ'd not build a component.

There is a Texas Instruments 1420 PCCard controller component.

When I connect USB devices like CD-ROM or Floppy drives, XPe does recognize them and ask for a driver if they are not yet installed. So I think that the internal message mechanism of XPe is working.

Are there additional components needed especially for PCCards? If yes, which are they?

Regards, Michael Jung
