Slobodan,

I am using NTFS – FAT is a poor substitute and I'd like to avoid it if at all possible.

I think that you are right about the permissions, but what are you suggesting I do?

Here's what I think you are suggesting: After running fbreseal, do not shut down right away. Instead, open up explorer and grant permissions (Or ownership) of the directories (Or entire hard disk?) to give the user "Administrator" permissions when the image is restarted. Is that it?

For my testing, I have only logged in as "Administrator", both before and after fbreseal. What I end up with is "\\Documents and Settings\Administrator", and "\\Documents and Settings\Administrator.NSXXYYZZ". After reseal, I am logged in as "Administrator.NSXXYYZZ".

Your hypothesis sounds like it is accurate, but does that mean that fbreseal cannot be used with an NTFS partition? YIKES!!! Or is it just a bug in fbreseal (Which I think it is – It should handle this issue for us).

Desi
