Hello

I get a process1_initialization_failure blue on first boot after a image is built. I've got embedded installed on my target pc, so the *.pmg is built to my target hardware. Since I don't want to tamper with the HD I've got the XP embedded tools installed on, I end up formatting a second HD (FAT) then I'm coping the contents on the Windows Embedded images folder over to the other HD. I physically swap the HD's to make the one that has been formatted and the image files copied onto the primary. I've run bootprep.exe on the HD, and the first time I boot I see the XP screen then get the error process1_initialization_failure.

Any ideas? Is there something I'm doing wrong?

Thanks
