Sean,
here the log excerpt with the complete building step name:

R: Building: "Windows XP Service Pack 2 Resource DLL [Version 5.1.2600.2180, R2890]"...
Error 1005 (0x3ED) in "PlatformLib::CopySrcFile2": File not found:
"ialmnt5.inf"

[...]

More errors of the same type follow.

Regards!

Fab

Hmm...I don't know the SP2 DLL is? Is this part of a custom component?

Hi Sean,
I'm working locally on my computer. So, the MSSQL server installed by XPe
studio is also on my computer.
Like you, I was supposing "network" problems (i.e. problem on MSSQL
connection), I checked on the logs, but I didn't find any trace. Of

Re: SP2 package corrupted

course, nor the computer reboot was successful.
Moreover, why the error is reported *only* after the "SP2 DLL" building ?
Didn't the build process uses the components manager database up to that
building point ? Mah...

Again, thanks for your prompt reply!

Regards
Fab

I guess you are trying to build an image...
Are you connected to a network when you built the image? If
you are not
conected to a network, you will get file not found errors.
Either connect to the network or change the Repository paths
in
Component Database Manager.

It is already the second time that happens to
me... Suddenly an image
build process ends with hundreds of errors.
I check the log and I see a lot of "file not
found" errors, immediately
after building the SP2 .DLL (exact label will
be available when I'll be
back to the office...), almost at the end of the
build process. The
only way to recover is to the install the SP2
package from the
Component Database Manager and to
reinstall it.

Now, I'm going to prevent it with a backup
of the repositories, but

Re: SP2 package corrupted
that shouldn't happen periodically!!!

Does it happen only to me ?

Regards
Fabrizio
