I'm curious – Why do you want to do this?

If you commit EWF at every boot, you are committing – nothing really. The system has just been restarted, and no-one has had time to make any changes, so.... what are you committing?

Maybe you really don't need the EWF if you are committing it all the time anyhow?

Jure,

Honestly, I couldn't quite understand how launching a console app problem is really connected to EWF. What I suggested earlier was creating a simple app that calls into the EWF API [commit]. Obviously, this app wouldn't care about any other console app(s) you might need to launch at run time but it would do the commit function you need.

Any console app you can launch with ShellExecute[Ex] call providing the SW_HIDE parametr as the nShowCmd argument (please refer to MSDN for more info). It should hide the app implicit console window on start (won't work for extra console windows that may be created by the app explicitely by calling console alloc API).
