Hi.

I'm building OpenGL support into my XPe. This is working with the Microsoft drivers. But instead of using the standard Microsoft drivers, I want to use the drivers of my graphic card, an Intel 855 Embedded graphics controller.

The driver uses the files iglicd32.dll and igldev32.dll for OpenGL.

I've added both to the image.

Also I've added the following RegKeys:

```
HKLM\Software\Microsoft\Windows NT\CurrentVersion\OpenGLDrivers\Intel\  
dll REG_SZ iglicd32  
DriverVersion REG_DWORD 0x1  
Flags REG_DWORD 0x3  
Version REG_DWORD 0x2
```

This are exactly the same RegKeys as they are installed in Windows XP Pro.

Yet XPe still uses the Microsoft OpenGL drivers, instead of the Intel drivers. It seems that I'm missing something here.

Can you help me out / think with me to solve this problem?

Thanx in advance,

LB
