I've noticed a couple weeks ago my windows xp clock is ALWAYS 13 minutes ahead. It keeps time fine while off so I know it's not the CMOS battery. So what is goin on? I tried changing it back to normal time, and about 15-30 seconds later it just jumps 13 minutes ahead, then proceeds to keep normal time. I've tried synchronizing with different sites, and even uncheck the synchronize button, ran a virus scan, but nothing seems to work. Any ideas?

Thanks for the help guys, take care!
